

## Abstract

5 A polylactic acid resin suitable for use  
especially in textile products; textile products  
obtained from the resin as a raw material (a fiber,  
multifilament, monofilament, staple, false-twist  
yarn, long-fiber nonwoven fabric, etc.); and  
processes for producing these textile products. The  
polylactic acid resin is a resin consisting mainly of  
a polylactic acid and is characterized in that it is  
10 linear, has an L-isomer content of 95 mol% or higher,  
an Sn content of 30 ppm or lower, a monomer content  
of 0.5 wt.% or lower, and has a relative viscosity of  
2.7 to 3.9 or has a weight-average molecular weight  
of 120,000 to 220,000 and a number-average molecular  
15 weight of 60,000 to 110,000. The textile products  
each comprises the polylactic acid resin as the main  
material. The textile products each comprises a  
polylactic acid excellent in processability and fiber  
properties and free from problems in practical use.
